City of Nelson Material Carbon Emissions Guide March 2022

**Notes:** For both of the DOE programs the 2021 Energy Code is a listed as a requirement for the thermal envelope. In the 2021 Energy Code if you are using a non CI wall system you must use section R402.1.5 "Total UA Alternative" that uses table R402.1.2. All values are given in U-Factor. For the "Wood Frame Wall U-Factor" section the total U-factor for climate zones 4-8 is U-0.045 or R-22. This is for ALL insulating elements in the exterior wall system. If the insulation and framing is at or above R-20 the wall system will qualify to be used since when all wall elements are added in you gain another R2-3 from those additions.

\* Some ESS examples have thermally broken plates assemblies

\*\* Based on most commonly used insulation for that wall assembly

\*\*Embodyed carbon units in kg of CO2e/m2
